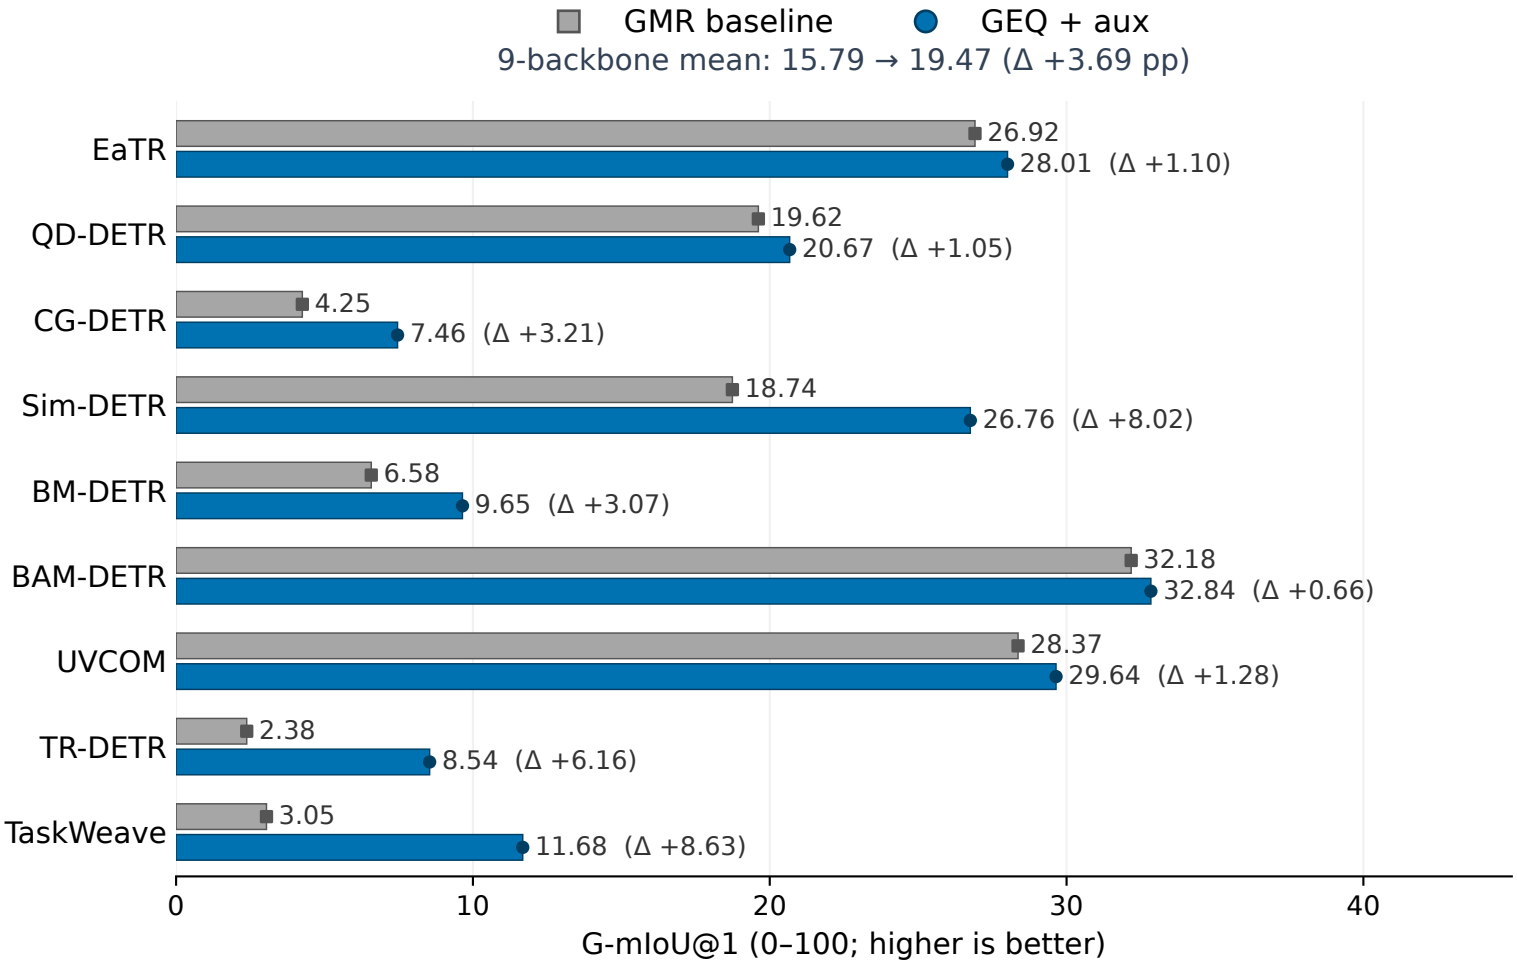
Full-Decodable Test | 2,970 / 2,986 queries

G-mIoU@1 at each method's Val-selected existence gate

86% Val positive-retention target (≥220/255) | selected 9/11 exploratory subset



Each backbone/method selects its own largest 0.01-grid threshold on Standard Val; the same threshold is used on both Tests.

Exploratory post-Test subset: Moment-DETR and LD-DETR are omitted because ΔG1 is not positive on both Tests.
