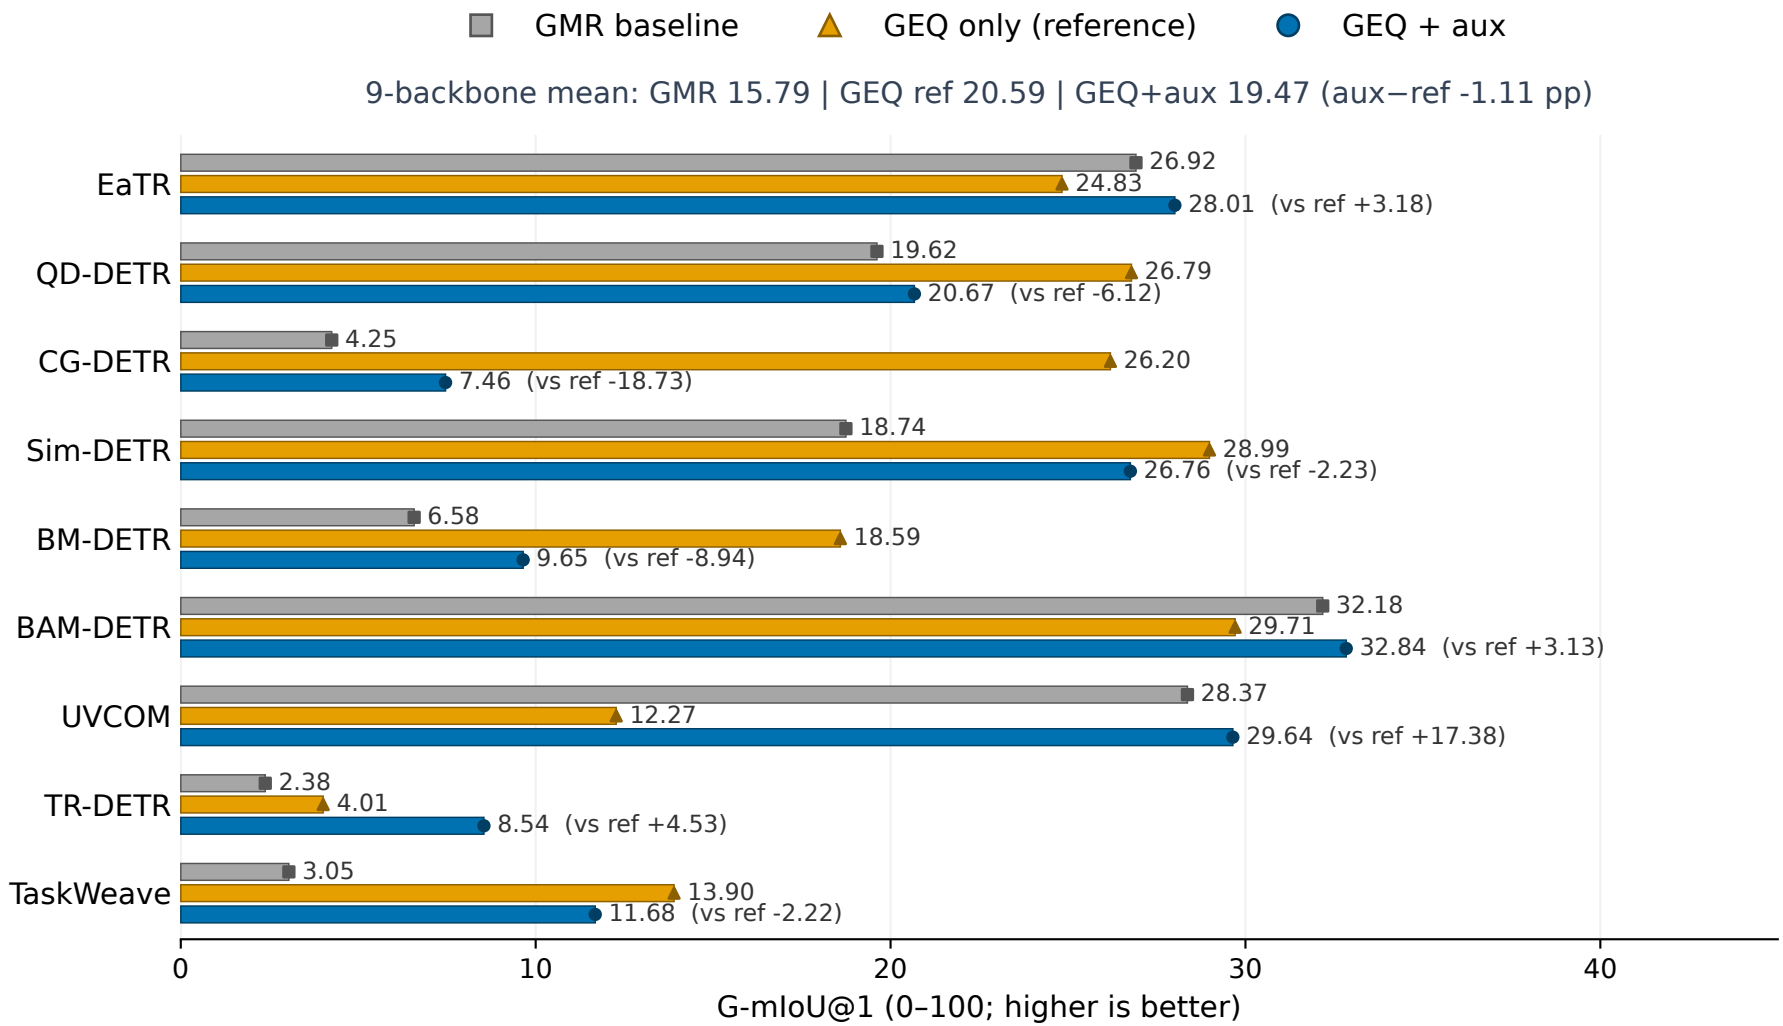
Full-Decodable Test | 2,970 / 2,986 queries

G-mIoU@1 at each method's independently Val-selected existence gate

86% Val positive-retention target (≥220/255) | selected 9/11 exploratory subset



Each backbone/method selects its own largest 0.01-grid threshold on Standard Val; the same threshold is used on both Tests.
Subset is fixed by current GEQ+aux vs current GMR gains, not by the GEQ-only reference. Moment-DETR and LD-DETR are omitted.
GEQ-only is an outcome-level reference with a different no-aux GMR parent/protocol; aux−ref is not a controlled causal ablation.
